# Project Portfolio Page (PPP)

---

## Overview

---

**FlashBang** is a CLI app designed to provide students with a smart way of studying for their modules. The app will manage a limited number of flashcards for a small number of modules, optimized for users who prefer a CLI.

## Summary of Contributions

---

### Code Contributed

[RepSense Link](#)

### Enhancements Implemented

#### 1. Command Classes:

- **What:** Developed various command classes to handle user input and execute corresponding actions.
- **How:** Implemented classes such as `AddCommand`, `DeleteCommand`, `FlashBangCommand`, etc.
- **Why:** These classes are essential for the app's functionality, ensuring that user commands are processed accurately and efficiently.

#### 2. Command Class Testing:

- **What:** Created unit tests for command classes to ensure they work correctly.
- **How:** Used JUnit framework to write tests covering different scenarios and edge cases.
- **Why:** Ensures the reliability and correctness of command implementations, leading to a robust application.

#### 3. Show FlashBang Percentage:

- **What:** Implemented a feature to show the percentage of correctly answered flashcards.
- **How:** Added methods to calculate and display the percentage based on user performance.
- **Why:** Provides users with immediate feedback on their study progress, enhancing the learning experience.

#### 4. Show FlashBang Mistakes:

- **What:** Added functionality to display the mistakes made by users during flashcard sessions.

- **How:** Implemented methods to track incorrect answers and present them to the user.
- **Why:** Helps users identify areas that need improvement, fostering more effective studying.

## Contributions to User Guide (UG)

### UG

- Wrote feature sections: `add`, `delete`, `flashbang`
  - **Add:** Detailed instructions on how users can add new flashcards.
  - **Delete:** Explained the process for removing flashcards.
  - **FlashBang:** Provided a comprehensive guide on using the flashbang feature.

## Contributions to Developer's Guide (DG)

### DG

- Wrote 'Parser component' section:
  - Explained the role and functionality of the parser in interpreting user commands.
- Made Parser Partial Class Diagram:
  - Created a visual representation of the parser structure.
- Made Parser Delete Sequence Diagram:
  - Illustrated the sequence of operations for the delete command.

## Contributions to Team-Based Tasks

### 1. Conducting Code Reviews and Providing Feedback:

- Reviewed pull requests to ensure code quality and adherence to project standards.
- Provided constructive feedback to team members, facilitating improvements and learning.

### 2. Maintaining the Issue Tracker:

- Managed the issue tracker by organizing and prioritizing tasks.
- Ensured that issues were addressed promptly and efficiently.

### 3. Updating User Docs:

- Documented the target user profile and other essential information for user documentation.
- Ensured that the documentation was clear, concise, and helpful for end-users.

## Review/Mentoring Contributions:

## DG Extract

---

### Structure

Below is a partial class diagram showing the interactions of the `Parser` class.

Parser class diagram

The sequence diagram below illustrates the interactions taking `parseCommand("delete --m cs2113 --i 1")` as an example. Sample delete call sequence diagram

### Example

How the `Parser` component works:

1. The `Parser` receives the command input.
2. It identifies the command type using `parseCommandType`.
3. Depending on the command type, it creates the corresponding command object (e.g., `AddCommand`).
4. The created command is executed, producing a `CommandResult`.
5. The `CommandResult` is then used by `Ui` to provide feedback to the user.
